

EMPLOYER ERGONOMIC SUMMARY

SAMPLE REPORT - FOR DEMONSTRATION PURPOSES ONLY

ABC Manufacturing - Workforce Ergonomics Summary

Report Date: June 1, 2026

This summary highlights workforce-level ergonomic patterns and priority actions. Individual employee recommendations are documented separately.

Workforce 24 employees screened Findings reflect aggregate trends across completed assessments. Helps prioritize high-impact improvements.	Risk Exposure 58% with >=1 flagged risk Most common drivers: posture + workstation fit. Supports targeted education + equipment planning.	Health Score EHS 74 / 100 (Monitor) Higher score = better ergonomic health. Improves as flagged risks are reduced.	Investment \$3,850 estimated Budgeting guidance for high-frequency needs. Final cost varies by vendor + quantity pricing.
---	---	---	--

Workforce Ergonomic Indicators

Indicator	Value	Meaning
Employees Screened	24	Total number of completed ergonomic assessments contributing to this summary.
Ergonomic Health Score (EHS)	74	Composite 0-100 score. Higher is better. (85+ strong, 70-84 monitor, <70 needs attention.)
Employees with >=1 flagged risk	58%	Prevalence of ergonomic risk exposure - guides broad vs targeted intervention planning.
Average ergonomic score	82	Overall workstation fit benchmark (average score across respondents).
Avg flags per impacted employee	3.2	Risk density among impacted staff - higher suggests multiple contributing factors per workstation.

Key Insights

- Ergonomic risk patterns observed represent workforce-level trends, not isolated individual concerns.
- The most common contributors are posture-related and workstation-fit factors, which are typically responsive to targeted equipment and brief education.
- Equipment recommendations reflect high-frequency, high-impact opportunities rather than exhaustive individual needs.
- Addressing priority items can support comfort consistency, early intervention, and injury prevention across roles.
- This summary supports HR planning, budgeting, and phased implementation; individual employee guidance is documented separately.

Top Risk Areas

Most frequently flagged ergonomic domains across assessed employees. Higher counts suggest broader exposure and stronger priority for intervention.

Top Safe Practices

Protective habits and strengths reported or observed. These patterns can be reinforced to improve consistency and reduce cumulative strain.

Top Equipment Recommendations

Most commonly recommended items across the workforce. Individual setup guidance and justification appear in each employee report.

Equipment	Emp.	Unit	Total	Link
Monitor Arm Improves monitor height and distance for neutral head and neck alignment.	8	\$45	\$360	View
Footrest Improves lower-body support when chair/desk height cannot be fully adjusted.	6	\$30	\$180	View
Adjustable Office Chair Improves lumbar support, seat height, and supported sitting posture.	5	\$275	\$1,375	View
Document Holder Reduces repeated neck flexion during document review and data entry.	4	\$20	\$80	View
Sit-Stand Workstation Supports posture variation and reduces prolonged static sitting.	3	\$450	\$1,350	View

Estimated Total

\$3,850

Emp. indicates the number of employees for whom that item was recommended (frequency across completed assessments). Vendor links are examples only and provided as a planning guide. Equivalent items may be purchased from any vendor. Estimated costs are intended to support budgeting and may vary based on vendor selection, product availability, and quantity discounts.

Program Notes

- This summary reflects aggregate ergonomic trends across the workforce.
- Findings highlight most frequently observed risks and recommendations, not every individual item.
- Equipment recommendations are prioritized by frequency and potential impact.
- Individual setup guidance and justification appear in each employee report.
- This report supports planning and prioritization, not individualized clinical assessment.

Recommended Next Steps

1. Prioritize employees with multiple flagged risks and higher risk-density workstations first.
2. Implement equipment updates with brief setup coaching to ensure correct fit and adoption.
3. Reinforce posture resets, neutral wrist/arm positioning, and microbreak habits throughout the workday.
4. Reassess in 30-60 days to confirm implementation, comfort impact, and remaining barriers.
5. Scale changes by role/department to support phased rollout and predictable budgeting.

Disclaimer: This sample ergonomic assessment is intended for educational and preventative demonstration purposes only and does not constitute medical advice.

ABOUT THE PLATFORM

About ErgoEase

ErgoEase is a digital ergonomic and home safety screening platform designed to identify risk factors and provide practical, role-specific recommendations for individuals and organizations.

How ErgoEase is used

- Individual ergonomic screening with personalized PDF reports
- Team and workplace screening with automated reporting
- Role-specific workflows across different job environments
- Home safety and aging-in-place assessments
- Custom screening solutions for unique use cases

Supported environments

- Office and desk-based work
- Dental and clinical environments
- Warehouse and industrial roles
- Driving and fleet-based work
- Healthcare and nursing
- Home safety and independent living

Why organizations use ErgoEase

- Identify ergonomic risk early before issues escalate
- Prioritize improvements across teams and roles
- Provide clear, professional reports for employees and leadership
- Support equipment planning and cost decisions
- Create scalable, repeatable screening workflows
